CLOCK IN · A SOLANA MOBILE HACKATHON

Penny Post

A letterbox for your wallet.

The post comes once a day: one question for every Seeker, and cards from people who paid to reach you.

Android · Solana Mobile Stack · Mobile Wallet Adapter · SKR

Every Seeker came with an address.

Nobody has ever written to one.

A .skr name points at a wallet. Today that makes it a place to receive tokens. Penny Post makes it a place where a person can be reached.

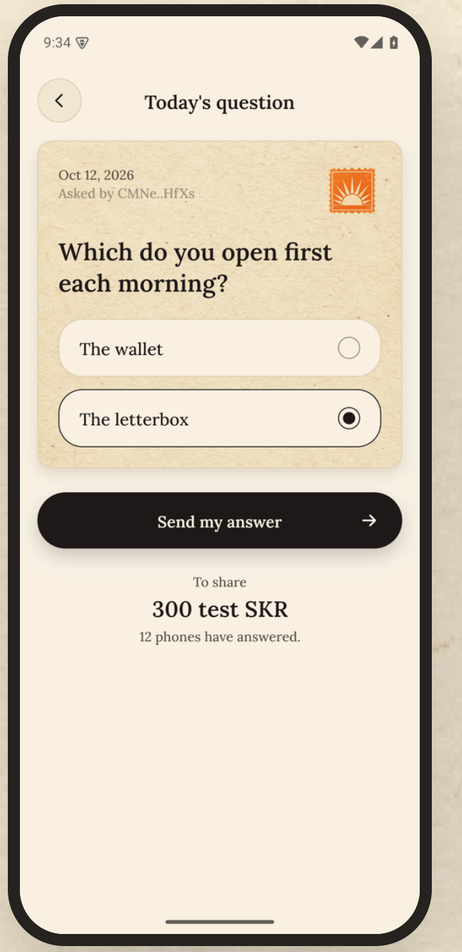

Every morning, one card for everyone

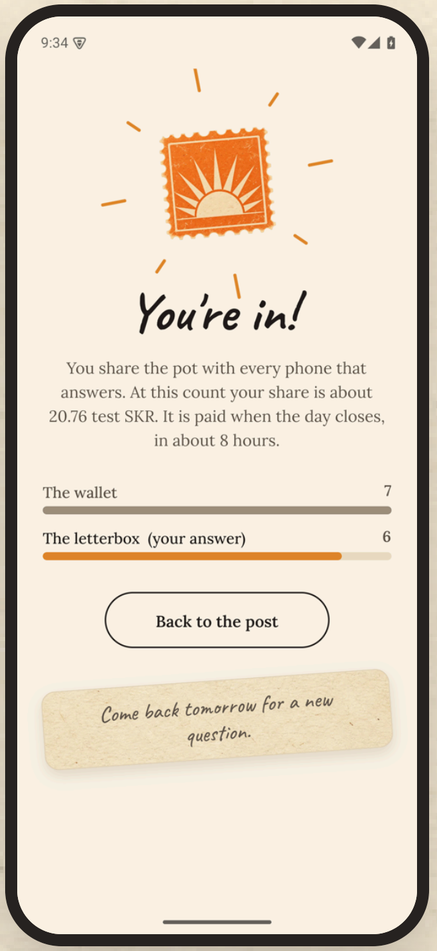

Somebody puts up SKR and asks every Seeker a question. Tap an answer, and everyone who answered shares the pot.

1. Whoever asks puts up the SKR. On devnet today the pot is 300 test SKR.

2. Each Seeker answers once. The program checks its Genesis Token, so ten wallets on one phone get one answer.

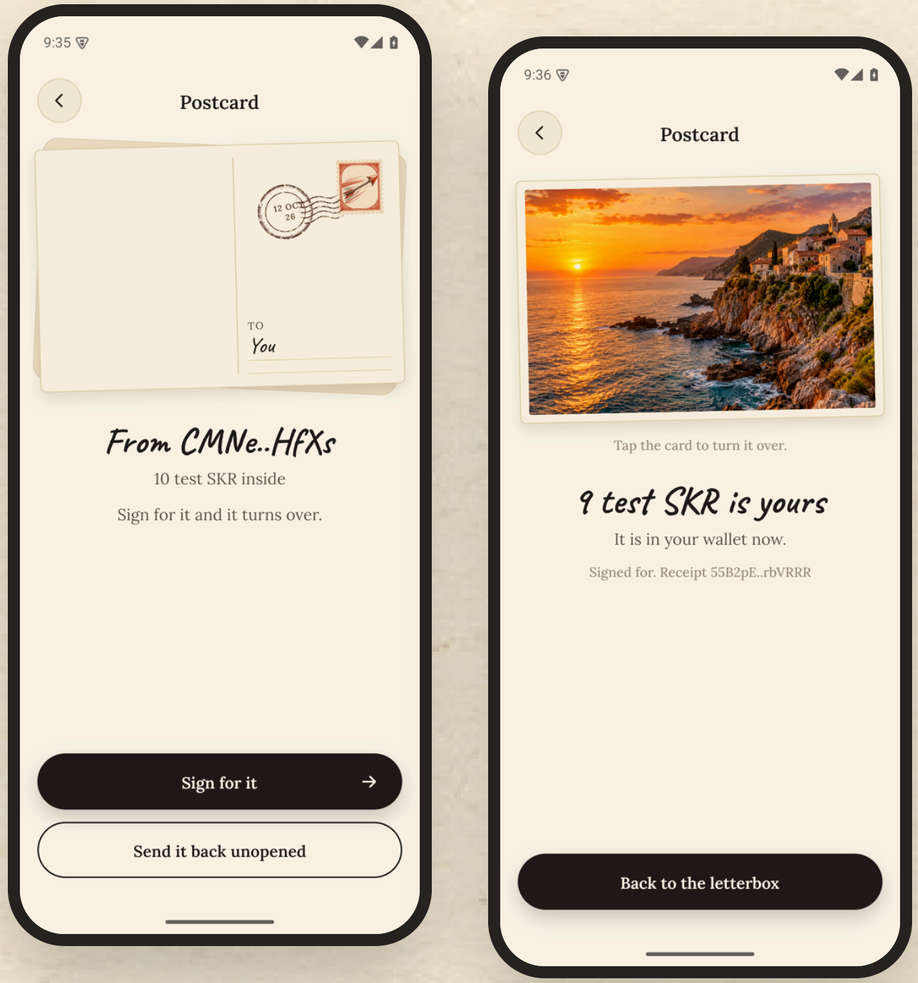

3. When the day closes, the phones that answered share the pot. If nobody answered, it goes back.

How a card travels

1. You write to a .skr name: a photo on the front, your handwriting on the back.
2. You sign once with Mobile Wallet Adapter. The postage goes into a vault that belongs to that one card.
3. At 08:00 where the reader lives, the card arrives face down.
4. The reader signs for it. The card turns over, and the postage is theirs.

Friends write free. Everyone else pays the reader.

 **A Seeker owner, once a day**	*Nothing*	A free stamp, counted against the phone's Genesis Token
 **Anyone else**	*The reader's price*	10 SKR to start. 90% to the reader when they open it, 10% burned
 **Someone in a hurry**	*20 SKR more*	Burned. The card skips the morning round
 **A card nobody opens**	*Nothing in the end*	All of the postage goes back after seven days

A letterbox takes three paid cards a day, and its owner sets the price. The reader never pays to receive anything.

It only works because of the phone

1 : 1

One Genesis Token, one free stamp a day.

The program reads the token's group membership on-chain. No server vouches for anyone.

The stamp is counted on the token, so moving it to a second wallet earns nothing.

A free card can only have come from a real Seeker, which is why a reader can trust it.

The check is tested on a real Genesis Token and on the real account that holds it.

Why people come back tomorrow

08:00

The post comes once a day, at eight on the reader's own clock. A bell rings on the phone. There is one reason to open the app, and it happens every morning.

10 sec

Answering the day's question takes ten seconds and pays a share of the pot. One signature collects yesterday's share and answers today's.

1 for 1

Write to a stranger and you join the line for the next stranger's card. A letterbox does not stay empty.

Postcrossing has run the same exchange with paper cards since 2005: more than 805,000 members and 85 million cards.

FOR BUILDERS

Reach Seeker owners without an airdrop.

Post a card to a letterbox. The postage waits in escrow. It is paid only when a real person turns the card over, and it comes back if nobody does.

Or ask every Seeker one question for a day. Each phone answers once, and your SKR goes to the phones that answered.

Three paid cards a day per letterbox, one question a day for everyone. Scarce by design, so both get read.

What is built

Program, twelve instructions	31 unit tests and 54 end-to-end tests, run on a fork of mainnet against real SKR and six real Genesis Tokens.
Android app	Every flow run from the signed release build: letterbox, the day's question, writing by hand, posting, signing for a card, sending back. Each transaction is dry-run before the wallet opens.
Practice wallet	No wallet app needed to try it. One tap makes a throwaway devnet wallet, puts up a letterbox and brings a welcome card.
Sealed letters	Encrypted to a key made on the reader's phone and kept in its secure storage.
.skr names	Looked up in both directions, and checked against AllDomains' own library on mainnet.
Three server functions	The card store and the exchange hold no keys and check every write against the chain. A devnet counter hands visitors test SKR and a test Genesis Token.
Devnet	Live at D5LZ7kUm…fz2MLAD since 12 October 2026, with a signed APK anyone can install. SKR and the Genesis Token are stand-ins there.

Where the money sits

- ✓ Every card has its own vault, and the card is its authority. There is no shared pool to drain.
- ✓ Only the reader's signature sends postage to the reader.
- ✓ A refund can only go to the sender, whoever sets it off.
- ✓ A sender never pays more than they signed for. They name the postage and the highest express fee, and the burn share is capped at 20%.
- ✓ On mainnet no server holds a key, and the app ships no API key.

A limit we state plainly

An open postcard is stored unencrypted under its hash. A modified app could read one without opening it. The postage would then sit unclaimed and go back to its sender.

On devnet today

13
letterboxes put up

12
answers to the day's question

21
days of questions scheduled

3
paid cards signed for

All of it is the builder's own testing. There are no users yet. The program is the same one that would run on mainnet, and it checks a stand-in Genesis Token exactly as it checks a real one.

PENNY POST

The post comes once a day.

Next: the Solana dApp Store, within thirty days of the results.
